A Disability by any Other Name

Why Children with Fetal Alcohol Neurodevelopmental Disorder Have Not Been Diagnosed and Treated (and what you can do about it)

Douglas Waite, MD
Assistant Professor of Pediatrics, Mount Sinai Hospital
Medical Director
The Keith Haring Clinic, Children’s Village
Dobbs Ferry, New York
Learning Objectives

- Highlight the history of fetal alcohol spectrum disorders and how this has shaped hesitancy to diagnose children and adults with this neurodevelopmental disability
- Identify the signs and symptoms that may indicate the presence of Neurobehavioral Disorder Associated with Prenatal Alcohol Exposure (ND-PAE)
- Why FASD should qualify as a disability under IDEA
- How we can work toward establishing community-based FASD-specific interventions
"Each of their mothers was an alcoholic"

The most common cause of intellectual disability and birth defects in the United States

Prevalence of Common Causes of Disability (per 1,000)

- ASD: 14.6
- Trisomy 21: 1.3
- Cerebral Palsy: 3.3
- FAS: 9.0
- FASD: 23.0
- ADHD: 110

Prevalence of cerebral palsy: Autism and Developmental Disabilities Monitoring Network, three sites, United States, 2004
https://www.cdc.gov/ncbddd/adhd/data.html
Alcohol Use and Binge Drinking Among Women of Childbearing Age—United States, 2011-2013

- 10.2% of US pregnant women, ages 18 to 44, said they drank alcohol in the past 30 days
- 3.1% of pregnant women reported binge drinking in the previous 30 days
- About one third of pregnant women who consume alcohol, binge drink
- White, college-educated women are the most likely to drink during pregnancy

MMWR, 9/25/15
Prevalent in foster care

- It is estimated that up to 70% of children in foster care have histories of fetal alcohol exposure
- 80% of children with FASD do not stay with their birth parents
- Children with fetal alcohol exposure spend more time in care and suffer more placements during their childhood

www.nofas.org
80% of foster children referred for FASD evaluation had never been diagnosed as affected by prenatal alcohol exposure.

Mental health diagnosis, learning and communication disorders, intellectual disability and objective signs of neurocognitive damage, were not recognized in a significant number of children with FASD.

Objective signs of neurocognitive damage were not recognized in a significant number of children with FASD.

The Effects of Prenatal Alcohol Exposure

- Specific facial characteristics
- Growth deficits
- Intellectual and Learning Disabilities (especially in math and social skills)
- Attention and memory problems
- Poor coordination and motor delays
- Difficulty with judgment and reasoning
- Speech delay and auditory processing disorder

“Of all the substances of abuse (including cocaine, heroin and marijuana) alcohol produces by far the most serious neurobehavioral effects in the fetus” (Institute of Medicine, 1990)
Traces of fetal alcohol exposure can sometimes be seen in the face
Prenatal alcohol-exposure affects the most basic processes of development.
- Fetal alcohol syndrome occurs in about 1 in 1,000 children
- Fetal alcohol related-neurodevelopmental disability occurs in at least 1:100 children
- More recent estimates are 2-5% in the US general population
- The prevalence of FASD in foster care is as high as 67 times greater than in the general population
Midline structures of the face and brain in an alcohol-exposed mouse embryo and a child with FAS

Comparison of the face (A) and interior brain (B) of a normal mouse embryo and one damaged by alcohol (C&D). The nostrils are abnormally positioned (C), the brain is missing midline structures (D).
Alcohol kills specific cells in the developing brain depending upon the stage of development.

The inside of a 10 day mouse embryo (corresponding to a 28 day human).

Cells killed by alcohol have taken up dark blue stain.

The Strange, Sad Tale of Phineas Gage
“The equilibrium or balance, so to speak, between his intellectual faculties and animal propensities, seems to have been destroyed. He is fitful, irreverent, indulging at times in the grossest profanity (which was not previously his custom), manifesting but little deference for his fellows, impatient of restraint or advice when it conflicts with his desires, at times pertinaciously obstinate, yet capricious and vacillating, devising many plans of future operations, which are no sooner arranged than they are abandoned in turn for others appearing more feasible. A child in his intellectual capacity and manifestations, he has the animal passions of a strong man…in this regard his mind was radically changed, so decidedly that his friends and acquaintances said he was "no longer Gage."

—John Martin Harlow, MD, 1848
Areas of the Brain Affected By Prenatal Alcohol Exposure

**Frontal Lobes** – impulses and judgment.; controls executive function

**Hypothalamus** - appetite, emotions, temperature, and pain sensation

**Amygdala** - emotions

**Cerebellum** - coordination and movement

**Basal Ganglia** - spatial memory, transitions, working toward goals, predicting behavioral outcomes, and the perception of time

**Corpus Callosum** - passes information from the left brain (rules, logic) to the right brain (impulse, feelings) and vice versa.

**Hippocampus** – memory, learning, emotion

Source: Dr. Sarah Mattson, University of San Diego
Defining Neurobehavioral Characteristics of FASD

- Impaired Executive function (conscious, goal-oriented behavior such as planning, execution, working memory, and inhibition of impulses in pursuit of goals)
- Behavioral dysfunction manifested by deficits in social functioning (aggressive and impulsive behavior)
- Attention and distractibility
- Language (auditory processing disorder, mixed receptive-expressive language disorder)
- Most children and adults have borderline to low average cognitive ability

Neurodevelopmental Disorder Associated with Prenatal Alcohol Exposure (ND-PAE)

Neurocognitive deficits *(one)*:
- Global intellectual performance
- Executive functioning
- Learning
- Memory
- Visual-spatial reasoning

Problems with self-regulation *(one)*:
- Mood or behavioral regulation
- Attention deficit
- Impulse control

Delayed adaptive skills *(two, one of which must be *)
- Communication deficit
- Impairment in social communication and interaction
- Impairment in daily living skills
- Impairment in motor skills
Intellectual Disability Equivalence

- Children and adults with FASD have IQ scores that may fail to reflect the full range of their intellectual deficits.
- Most people with FASD have normal to borderline intelligence (above 70) but have low adaptive behavior skills.
- Low adaptive behavioral skills is a hallmark of FASD.
- Disability equivalence allows accommodations for services despite IQ scores above 70.

Developmental Age and FASD

Diane Malbin, 1994
Secondary Disabilities

95% of children with FASD suffer from at least one psychiatric syndrome that in contrast to physical features of FAS, are long-lasting, pervasive and devastating to development.

The Neurodevelopmental Disorders

FASD
Prevalence 2-5%
1 in 20-50 Children

ASD
Prevalence 1.46%
1 in 68 Children

FASD+ASD 2.6%

ADHD
Prevalence 11%
1 in 9 Children

FASD+ ASD 52.9%

The Neurodevelopmental Disorders

ASD
- Difficulties in relating to others & initiating social interaction
- Restricted patterns of behavior, interests, and activities
  - Difficulty sharing feelings and using verbal & nonverbal communication
  - Inflexibility to routines and rituals

FASD
- Delayed verbal and non-verbal skills with acquisition of expressive language but persistent difficulties in receptive language
- Acts young for age, indiscriminate friendliness and interpersonal boundaries
- Oppositional and at times aggressive behavior
- Difficulty with transitions and change
- Impulsive, acts without thinking of consequences
- Lying or cheating, steals from inside and outside home
- Difficulty remembering new material and thinking about multiple or abstract concepts
- Deficits in visual-spatial skills, encoding of information, and flexibility in problem solving

ADHD
- Can’t concentrate with poor focus and sustained attention
- Can’t sit still, restless, hyperactive
- Impulsive or acts without thinking.
- Adaptive behavior improves with age
The Trajectory of FASD

- 61% have disrupted school experiences
- 60% become involved with the criminal justice system
- 50% are incarcerated
- 49% have inappropriate sexual behaviors
- 35% have drug and alcohol problems
How can prenatal alcohol-exposure be determined?

- Maternal history or disclosure
- History obtained from relatives
- Documentation in prenatal medical records
- Previous or subsequent siblings with history of alcohol or substance exposure
- Biomarkers (hair, meconium, blood, urine)
Histories suggestive of possible prenatal alcohol exposure

- Early placement in foster care
- Primary guardian other than the child’s mother
- Early childhood behavioral and school difficulties
- Successively poorer pregnancy outcomes, low birth weight, miscarriage, developmental delay or sibling born with positive urine toxicology (cocaine)
- History of domestic violence
Concurrent use of drugs and alcohol is common, not the exception

- 5.4% of pregnant women have illicit drug use during pregnancy (SAMHSA)
- Of children diagnosed with an FASD, 83% of the mothers reportedly smoked during pregnancy, up to 67% reportedly used illicit drugs during pregnancy, and over 75% of the children were in foster or adoptive care
- Drugs such as cocaine, opiates, amphetamines, marijuana and tobacco also affect fetal neurodevelopment
- Children born to mothers who used a higher number of different drugs during pregnancy had greater neurocognitive deficits that became more apparent over the course of childhood
- Fetal alcohol spectrum disorders are a paradigm for exposure to other environmental neurotoxins that cause similar neurobehavioral disabilities
A Disability, *not* a Disorder

- The term *neurodevelopmental disorder* should be changed to *neurodevelopmental disability*, as the behavioral disabilities seen in adults and children prenatally exposed to neurotoxins are but manifestations of an underlying dysgenesis of the central nervous system during neurodevelopment.

- This nomenclature highlights the disability, rather than the often difficult to manage behaviors these children and their families struggle with, while implying the need for disability-specific services under the imperative of the Individuals with Disabilities Education Act.
A disability by any other name

- Only a fraction of children and adults with FASD meet criteria for Part B of IDEA, often only qualifying in the category of learning disabled, behavior disorder, or other health impairments.
- Only 24% of children with FAS and 7–16% of children with fetal alcohol effects meet the basic criteria of an IQ of below 70, despite having significant neurobehavioral and adaptive function deficits that place as many as 60% of children with FASD at risk for school failure.
- These hidden deficits, often not seen on traditional IQ testing, severely impair the trajectory of their lives.

</table>
“Several months ago he jumped in the gap between the train and the platform on 125th street. He was not upset or obviously dysregulated. I was holding his hand and able to pull him back up to the platform. He requires constant supervision outside because he frequently wanders into the street or will bolt from the playground into oncoming traffic seemingly unaware of danger.”

“There's no more head-banging, fecal smearing, night terrors, vomiting, episodes of inconsolable sobbing etc. However, he gets up 4-6x per night, very calmly but cannot sleep through out the night..”

“He is extremely empathetic, sometimes to the point where I think it becomes a negative and he takes on other people's emotions. He's always asking people if they are ok, brings his artwork home as gifts for his siblings etc. He's also excellent at imitating people's mannerisms. He is very imaginative and enjoys drawing, loves swimming, very affectionate, loves to be read to, remembers parts of the book and asks questions.”

”He continues to have episodes of inconsolable sobbing at home where the cause is not clear. He can get stuck on an idea, repeating a phrase over and over again even if it doesn't fully make sense. For example, I want to go home when we are home.”

“He’s very interested in friends, but has no sense of personal space which is often interpreted as aggression on the playground but he's definitely gentle just has no boundaries. ”

“He seems to know colors or counting on Monday but not remember on Tuesday.”
Because of the persistent nature of the impairments associated with prenatal alcohol exposure, there is need for interventions that address the manifestations of these impairments across the entire life-span.

Interventions

- Education of parents and foster parents
- Highly structured, consistent routines
- Limited stimulation
- Simplicity with concrete language and examples
- Repetition
- Realistic expectations
- Supportive environments
- Supervision
Building Community-Based FASD-Specific Intervention Services

**Early Intervention**
- PT, OT
- Speech/Language
- Adaptive
- Social Communication
- Sensory Processing

**Diagnostic, Medical & Mental Health Services**
- Neuropsychiatric Testing
- Psychiatric Treatment

**CSE Services**
- Least Restrictive Environment
- PT, OT
- Speech/Language
- Vocational

**Support & Advocacy Networks**
- Education
- Emotional support for birth parents and caregivers
- Advocacy within Educational, Legal, Juvenile Justice & Social Services

**Individual Skills Training**
- Focus on strengths
- Social/Friendship Skills
- Teen Groups, Mentors
- Personal Safety & Adaptive Skills
- Executive Function Skills
- Time & Money Management
- DBT, CBT
Where do We Go From Here?

- Expand focus beyond national education to developing local on-the-ground services
- Funding (local non-profit organizations, individuals, state and local government grants)—donors like to give local
- Regional conferences on FASD to local build coalitions
- Advocate and develop community-based services for families of children with prenatal alcohol and drug exposure
- National partners already in place include NOFAS, AAP, CDC, Administration for Children & Families, CWLA
Tell the boys of the New York Juvenile Asylum that they must follow Truth, Justice and Humanity if they wish to become useful and honorable men."
Abraham Lincoln, 1860
